# Market Review

Global developed markets advanced during the quarter, with all regions posting gains. However, sector leadership shifted to more interest rate-sensitive sectors as global monetary conditions changed.

This quarter marked the end of the US rate-hike cycle that began in early 2022 to tame surging inflation triggered by the COVID-19 pandemic and its aftermath. With inflation heading back to the Federal Reserve's (Fed) target, the central bank shifted its focus to its second mandate: maximizing employment. After keeping rates unchanged in July, the Fed cut the federal funds rate by half a percentage point in September to head off further weakening in the labor market. The European Central Bank also lowered rates, delivering its second cut in three months to support the region's faltering economy, now that inflation is cooling there as well.

Conversely, Japan's central bank caught markets off guard with an interest rate *hike* in late July, causing a swift appreciation of the yen. This sudden currency shift disrupted the widely used yen carry trade, a popular strategy where investors borrowed at low Japanese rates to purchase higher-yielding foreign assets. The rapid unwinding of these positions, combined with weaker US economic data and disappointing earnings from US technology giants, ignited a market firestorm. The resulting

volatility culminated in a dramatic 12% drop in Japan's Nikkei index on August 5, a marked sell-off in stocks with positive price momentum, and a spike in expected US equity-market volatility to 40%—a level not seen outside of major crises.

But markets rebounded almost as quickly as they had fallen. By the end of August, all regions and sectors recovered from the brief but intense period of disruption to post gains for the month. Toward the end of the quarter, China unveiled a sweeping stimulus package aimed at reducing borrowing costs to boost credit availability. Key measures included lowering the minimum down payment on mortgages to 15% to stabilize the struggling residential real estate market, as well as the creation of a new lending pool to encourage share buybacks and to enable asset managers to buy more domestic stocks. Additionally, positive signals from the Politburo hinted at further fiscal support to come. Despite a lack of specifics, the end of policy inertia was welcomed by a market facing a fourth consecutive annual decline. The resulting buying frenzy pushed the MSCI China Index up more than 20% in just two weeks—its strongest performance in more than a decade. Year to date, China's market has now outperformed those in the US and Japan. Companies with significant exposure to Chinese consumers, such as European and Japanese cosmetics and luxury-goods makers, also saw their shares rally.

The US dollar weakened in the quarter, with the US Dollar Index (DXY)—which tracks the dollar's performance against a basket of major currencies—falling by nearly 5%, led by the surge in the Japanese yen, which appreciated 12% against the dollar.

## MSCI World ex US Index Performance (USD %)

Sector	3Q 2024	Trailing 12 Months
Communication Services	11.7	26.8

MSCI World ex US Index	7.8	25.6

Source: FactSet, MSCI Inc. Data as of September 30, 2024.

In the US, the yield of the two-year Treasury bond fell below its 10-year counterpart, ending the prolonged yield curve inversion that began in mid-2022 when the Fed started raising rates. Yield curves in Europe showed a similar pattern, with the UK and Germany un-inverting, and the spread widening further in France, Italy, and Spain. The US 10-year yield declined 73 basis points to 3.63%, giving a noticeable benefit to potential homebuyers via lower mortgage rates. European bond yields declined more modestly.

Despite escalating Middle East tensions and a late-quarter recovery in industrial metals prices spurred by China's stimulus, the Bloomberg Commodity Index declined about 3% in the quarter, largely due to a drop in oil prices. Brent crude fell US\$15, settling at US\$72 per barrel, as expectations of increased supplies from OPEC and rumors that Saudi Arabia may abandon its US\$100 per barrel target weighed on the market.

From a sector perspective, interest-rate-sensitive sectors such as Utilities, Financials, and Real Estate posted strong gains, while Information Technology (IT) declined. The semiconductors &

Companies held in the portfolio at the end of the quarter appear in bold type; only the first reference to a particular holding appears in bold. The portfolio is actively managed therefore holdings shown may not be current. Portfolio holdings should not be considered recommendations to buy or sell any security. It should not be assumed that investment in the security identified has been or will be profitable. A complete list of holdings at September 30, 2024 is available on page 9 of this report.

semiconductor equipment industry was especially weak, falling roughly 18%. Communication Services fared well, while the Energy sector declined, dragged down by lower oil prices.

**In the US, the yield of the two-year Treasury bond fell below its 10-year counterpart, ending the prolonged yield curve inversion that began in mid-2022 when the Fed started raising rates. Yield curves in Europe showed a similar pattern.**

The Pacific ex Japan region was the top performer, lifted by the nearly 25% return in Hong Kong, which rose sharply late in the quarter in step with the Chinese market. Despite its heavy exposure to Energy stocks, Canada did well due to strong gains in Financials, while Japan and Europe both trailed slightly.

In terms of style effects, the fastest-growing companies underperformed. The top quintile of growth stocks rose by just over 1.5%, while all other quintiles posted gains over 9%. High-quality stocks also lagged. The MSCI World ex US Momentum Index, which emphasizes stocks with high recent price gains, underperformed this quarter but remains about 6 percentage points ahead of the core index for the year. Across the main MSCI style indices, value did better than growth in developed markets but trailed slightly in Emerging Markets.

## Performance and Attribution

The International Developed Markets Equity composite rose 10.0% gross of fees in the third quarter, outpacing the 7.8% gain of the MSCI World ex US Index. In the year to date, the composite has returned 11.9% gross of fees, trailing the 13.6% return of the index.

This quarter's strong relative performance was driven by favorable stocks across sectors and regions. Our Health Care holdings were notably strong, but we also witnessed good performance in the Consumer Discretionary and Financials sectors. Regionally, our Japanese stocks significantly outperformed the benchmark, as did our European stocks, though our Canadian and Emerging Markets (EM) stocks dragged on performance.

In Japan, which was our best-performing region, investors appeared to appreciate the ongoing business growth our companies are generating, after spending the first half of 2024 focused on value plays. Our holdings within Japanese healthcare posted encouraging operational results, as pharmaceutical companies **Chugai Pharmaceutical** and **Shionogi** as well as hematology testing systems maker **Sysmex** gained, as did bicycle parts manufacturer **Shimano**, and consumer electronics powerhouse **Sony**.

In Europe ex EMU, Denmark was a standout market as our holdings in **Coloplast** and **Novonosis** gained, while shares of index heavyweight Novo Nordisk fell this quarter. UK based consumer health company **Haleon** announced good second quarter results

and increased full year profit growth expectations, helped by accelerating toothpaste and health supplements sales. Within the EMU, our financial holdings were strongest, led by Dutch payment processor **Adyen** and German insurer **Allianz**, both of which delivered favorable second quarter results and outlooks.

Our weakest region this quarter was EM, where we maintain a modest off-benchmark weight to EM companies operating primarily in developed markets. South Korea's **Samsung Electronics** was our biggest drag on relative performance, as the company's rebounding second quarter profitability and favorable outlook for Artificial Intelligence (AI) memory sales in the second half of the year wasn't enough to assuage concerns that it was inadequately capturing AI memory chip market share or that the budding memory price upcycle could start to fall again next year.

### Third Quarter 2024 Performance Attribution

### Geography

Intl. Dev. Markets Equity Composite vs. MSCI World ex US Index

"OTHER": Includes companies listed in the United States. "FRONTIER": Includes countries with less-developed markets outside the index.

Source: Harding Loevner International Developed Markets Equity composite, FactSet, MSCI Inc. Data as of September 30, 2024. The total effect shown here may differ from the variance of the composite performance and benchmark performance shown on the first page of this report due to the way in which FactSet calculates performance attribution. This information is supplemental to the composite GIPS Presentation.

Our Health Care stocks were strong, gaining almost 50% more than the index's 12.3% rise. Chugai was the largest contributor, helped by strong quarterly earnings results from hemophilia treatment sales, and continuing optimism regarding its prospective obesity pill in trials with partner Eli Lilly. **Roche**, **Symex**, **Shionogi**, **Sonova**, and **Alcon** each posted double digit gains as ongoing growth in their businesses reminded investors of their multifaceted growth opportunities. During the quarter, non-owned Health Care sector heavyweight Novo Nordisk fell despite positive earnings growth as investors perhaps increasingly contemplated challenges to its weight loss drug Wegovy from both rivals and potential next-generation drugs.

Our Health Care stocks were strong, gaining almost 50% more than the index's 12.3% rise. Chugai was the largest contributor, helped by strong quarterly earnings results from hemophilia treatment sales, and continuing optimism regarding its prospective obesity pill in trials with partner Eli Lilly.

Our Consumer Discretionary stocks performed well, with Chinese appliance maker **Haier Smart Home** rising on good second quarter earnings, ongoing air conditioning market share gains, and hopes that Chinese stimulus measures can further boost growth.

Financials holdings outperformed, led by life insurer **AIA Group**—which posted solid second quarter results and enjoyed the uplift in sentiment late in the quarter from China's economic stimulus announcements—and by global insurer Allianz, following solid first half results and an improving growth outlook.

Consumer Staples was among our weaker sectors, with **L'Oréal** facing slowing growth in China and the US amidst tighter consumer spending, and **Nestlé** reducing its revenue guidance as consumers reined in spending, leading to the ouster of the company's CEO. The new CEO pledged to invest more in its brands to support growth.

### Cumulative Excess Returns

MSCI World ex US Momentum vs. MSCI World ex US

Source: MSCI Inc., Bloomberg. Data as of September 30, 2024.

Our outperformance in the third quarter only partly reversed our underperformance of the first half of the year, when index gains seemed driven by a handful of themes in which we were only partially participating (such as AI and semiconductor plays and weight loss drugmakers), or entirely absent from (such as Japanese financials and holding companies). Year-to-date, our performance is nevertheless disappointing, hurt by stocks in Health Care (**Genmab**) and Information Technology (**Infineon Technologies** and Samsung).

## Perspective and Outlook

Earlier this year, the International Developed Markets Equity portfolio underperformed its benchmark because we held too few of the large index stocks that have risen the most. It's particularly frustrating because some of these top performers are high-quality, growing companies within our opportunity set that we do not currently own. Portfolio analytics indicate that our portfolio exhibits no exposure to the "momentum factor" as we take care to emphasize other attributes, especially those of high quality and rapid growth, in the companies we own. As we discuss below, we think the analytical observation is a misdirection, pointing towards actions unlikely to help us achieve future outperformance.

Price momentum refers to the well-documented phenomenon where securities whose prices have risen are more likely to keep rising in the short run, while those that have fallen are more likely to experience further declines. The precise causes of this phenomenon are debated, but the evidence is strong enough for it to be classified as a "factor"—a recurring pattern associated with positive excess returns. We're persuaded that momentum is closely linked to investor psychology, namely conservatism in (under) reacting to new information, and the tendency to extrapolate existing trends. The concept of momentum has garnered sufficient adherents to secure its place in the pantheon of portfolio analytics and inspire the creation of numerous indices and ETFs designed to exploit it, as well as a group of active investors that range from the most sophisticated quants to the most naive amateurs.

We have deliberately resisted incorporating the momentum factor into our investment process for several reasons. First, despite being well documented, simple price momentum does not provide a fundamental basis for making investment decisions. Serial correlation of share price changes has, at best, a weak connection to the underlying business you're investing in, and nothing to do with what it is worth. Second, momentum investing is literally "chasing" stocks that have already gone up or outperformed (or selling those that already went down or underperformed). This approach carries real-world costs. Our trading desk estimates that trades executed in a stock with strong momentum cost, on average across all markets, up to 400 basis points more than trades involving stocks with little or no price momentum. For a strategy such as ours, which turns over its portfolio roughly 25% a year, a 4% trading penalty would subtract 100 basis points of alpha every year. Even worse, attempting to keep up with the ever-changing group of momentum stock leaders typically demands significantly more than 25% annual turnover, while frequently conflicting with our fundamental and longer-term investment conclusions.

Third, although momentum investing has shown net positive returns over very long periods, there is considerable volatility in its return path, with frequent momentum reversals leading to sharp "drawdowns" in performance. This whipsaw effect makes momentum investing much harder to stomach in practice than it appears in theory. Moreover, unlike high-quality portfolios or even value portfolios, where drawdowns typically increase future expected returns, a momentum reversal offers no such silver lining. In fact, when momentum turns against you, there's reason to believe that the portfolio has become less attractive, not more.

The biggest drawback may lie in a related but distinct area. Over the last 18 months, disciplined fundamental investors have been challenged by an episode of momentum concentrated in a few of the largest stocks in the market. When the biggest companies, with the largest market capitalizations, experience highly correlated share-price rallies, momentum returns become aligned with overall market returns. In such cases, a more troubling form of momentum emerges—one increasingly driven by the fear of missing out (FOMO).

Investors who hold the winning stocks are happy to hold on, while those who don't quickly feel the pressure of "missing out," amplified by the constant media coverage that acts as free advertising for these market leaders. Passive investors inadvertently pour more capital into these heavyweight stocks in ever-increasing percentages, further amplifying their impact. As a result, the momentum behind these stocks grows ever stronger, and they come to dominate index returns. All (human) investors who measure themselves against a benchmark index feel drawn to jump on the bandwagon.

There can be, naturally, a link between stock-price momentum and company fundamentals: When a profound and structural change is harnessed by one or more companies over a long period, sustained profit growth should find itself linked to an extended share-price appreciation. A clear example is Apple, where even

casual observers can recognize the transformative impact its products have had on consumer behavior, a shift reflected in its share price over the past two decades. Less iconic examples include **Schneider Electric's** role in the global trend toward electrification of industry this decade and L'Oréal's expansion into emerging markets with branded cosmetics products over thirty years.

**Over the last 18 months, disciplined fundamental investors have been challenged by an episode of momentum concentrated in a few of the largest stocks in the market.**

Most equity investors fail to immediately appreciate the scale and longevity of such trends. This delay—what's referred to above as under-reaction behavior—allows fundamental growth to drive price momentum, by enabling a sustained compounding of earnings that surpasses the attention span of initial excitement. Research by Hendrik Bessembinder illustrates that these "profound and structural changes" tend to follow a power-law distribution—a pattern seen in the returns of venture capital: a small number of incidents have a disproportionate impact, often referred to as the 80/20 rule. A minority of companies experience sustained appreciation due to real, underlying causes, making these few cases the most consequential in terms of value creation.

An aversion to momentum, perhaps formalized with a pre-committed, mechanical sale rule, risks forfeiting enormous potential gains when an extraordinary case delivers a disproportionately large and sustained run of value creation. This possibility is worth serious consideration in today's market, where we see such dynamics possibly at play with NVIDIA in the US, leading weight-loss drug developers Novo Nordisk of Denmark or Eli Lilly in the US, and the broader Artificial Intelligence ecosystem residing primarily within the IT sector.

Nevertheless, most of the time investors tend to overestimate the number of transformative changes that will actually materialize, often falling into a pattern of "being slow to overreact" as one of our colleagues aptly described the behavioral two-step that has fueled many instances of momentum and inevitable reversals. The FOMO response to price momentum is clearly associated with poor investment decisions, and, in our experience, is most acute when it's most dangerous—near the peak of market trends, or worse, an investment bubble. We suspect that FOMO has been a significant element contributing to some of the most damaging drawdowns in the performance record of momentum investing, and we expect it will likely feature in some doozies to come.

For all our tools to promote objectivity and our culture of awareness surrounding the behavioral pitfalls in investing, we can be just as susceptible as other investors to such temptations. To stiffen our resolve, we've made pre-commitments in the form of absolute limits in our risk guidelines, which are primarily aimed at enforcing diversification in our portfolios, but secondarily act as brakes to curb our enthusiasm. We set maximum limits on

holdings of single securities to keep us from the most basic of fundamental company infatuations. We also set maximums on aggregate investments in single industries and sectors, as well as individual countries.

These are fixed limits, preferably set in moments of low controversy and neutral enthusiasm for those classifying categories. They later compel us to look through and beyond current fashion and consensus to recall and consider the investment world as it long has been and as it may be again in less florid times. These limits are arrived at from a common-sense perspective, rather than scientifically. We have altered them from time to time as reasonable considerations of changing opportunity size and enduring alterations in market significance have become manifest.

For all our tools to promote objectivity and our culture of awareness surrounding the behavioral pitfalls in investing, we can be just as susceptible as other investors to such temptations. To stiffen our resolve, we've made pre-commitments in the form of absolute limits in our risk guidelines, which are primarily aimed at enforcing diversification in our portfolios, but secondarily act as brakes to curb our enthusiasm.

Inevitably, we face pressure to bend or break those risk guideline pre-commitments when FOMO is greatest. (By the way, well-schooled portfolio managers trot out sophisticated terms such as “enforced tracking error” instead of “FOMO.”) But our long experience with these absolute limits—such as the benefits of maximum weights in China (2020), in Brazil (2006-7), in Emerging Market banks (2012), in the IT sector (back in 1999-2000), and minimum weights in the US (2004-5) and in Japan (1998)—serves as positive reinforcement for a discipline that some find to be commercially unhelpful, and others find to be simply constraining without a corresponding well-researched theoretical underpinning.

For the moment, as is visible in the graph above, the fever for AI-related semiconductor stocks and the first wave of weight-loss drugmakers has broken, oddly at the same time that the crowding into Japanese stocks with low price-to-book ratios did. No possible investment thesis that we have heard can tie all three of those market themes together, but they all fell apart as one in less than a month over the summer. And that's really the problem with momentum investing: It works until it doesn't, and when it doesn't, all the gains you made can be reversed more quickly than you can exit the market. Gains of months are squandered in days.

## Portfolio Highlights

In August, we liquidated our holdings in Russian oil producer Lukoil. Given the ongoing war in Ukraine, and the uncertainty

facing the company, along with our limited ability to transact in the shares, we deemed it prudent to sell after receiving a credible and reasonable offer for the shares. Although the sale price was roughly one-quarter of Lukoil's pre-invasion value, it was higher than some sellers accepted just two weeks before the shares ceased trading in the West in 2022.

We also sold our holding in German drugmaker BioNTech. Since our purchase, its earnings from COVID vaccine sales have fallen further than expected. Rather than experiencing two to three years of lower earnings that could fund operations and R&D, the consensus now projects losses for the next three years. While BioNTech's balance sheet remains exceptionally strong due to past vaccine revenue, ensuring that its development activity remains unhindered, this shift renders the investment thesis more uncertain. Holding the stock now requires looking through several years of losses, turning it into a more speculative biotech venture investment, rather than a profitable business with upside optionality. Additionally, the company's expansive cash reserves coupled with no operating profits have resulted in it being classified as a Passive Foreign Investment Company (PFIC), imposing an additional tax burden on US investors. These factors combined led us to exit our investment for the time being.

Last quarter, we discussed the potential market impact of various elections worldwide, highlighting the upcoming US election in November as likely the most consequential. One key issue in this election that could affect international investors is US tariffs on global trade. While we won't attempt to predict the election outcome, potential policies, or their effects, we can outline the degree to which our investments are exposed to the US market.

We estimate that approximately 24% of our portfolio's weighted revenue is generated from the US, with minimal direct exposure to tariffs or trade restrictions. When examining our holdings with the highest concentration of US sales, we find little serious tariff risk. For instance, our Health Care companies—Roche, Genmab, and Alcon—each derive around half of their revenues from the US but manufacture much of their US-bound production domestically. Moreover, pharmaceutical companies benefit from the WTO Pharma Agreement of 1994 which eliminated tariffs among most developed countries on finished pharmaceutical products and active ingredients. However, the companies do face some risk from potential efforts to undermine drug prices, which could have long-term consequences by discouraging new discoveries.

Canadian convenience store operator **Couche-Tard**, which derives 63% of its revenue from the US, largely from its 7,000 Circle K Stores in the US, faces no more tariff hurdles than its domestic competitors. **Dassault Systèmes**, which generates over half of its revenue from the US, sells design software and services that are unlikely to face tariffs. However, its largest customers in the automotive and aerospace industries could see varying effects from potential trade tariffs.

TSMC is perhaps our holding with the most significant export exposure—manufacturing most of its products in Taiwan, while generating half of its revenue from the US. In response to US policies aimed at reducing dependence on semiconductor imports, TSMC has been granted incentives to build advanced chipmaking plants in the US, with mass production from its first facility in Arizona expected to begin supplying American customers in 2025.

**HL International Developed Markets Portfolio Geographic Revenue Split Weighted by Holdings**

Source: HL Holdings Weights and HL Analyst Estimates. Data as of September 30, 2024.

Chinese appliance maker Haier Smart Home derives 29% of sales from the US. While imports from China are a contentious issue in the US election, most of Haier’s products sold in the US are produced at US plants, largely acquired via its 2016 purchase of General Electric’s appliance division which has retained its Kentucky headquarters. Earlier in the quarter we sold our other Chinese holding, Sanhua Intelligent Controls, as the company’s free cash flow has weakened in the face of rising capital expenditures on its autoparts business—a segment that we anticipate will face competitive and cyclical headwinds coming years.

The portfolio is actively managed therefore holdings identified above do not represent all of the securities held in the portfolio and holdings may not be current. It should not be assumed that investment in the securities identified has been or will be profitable. The following information is available upon request: (1) information describing the methodology of the contribution data in the tables above; and (2) a list showing the weight and relative contribution of all holdings during the quarter and the last 12 months. Past performance does not guarantee future results. In the tables above, "weight" is the average percentage weight of the holding during the period, and "contribution" is the contribution to overall relative performance over the period. Performance of contributors and detractors is net of fees, which is calculated by taking the difference between net and gross composite performance for the International Developed Markets Equity strategy prorated by asset weight in the portfolio and subtracted from each security's return. Contributors and detractors exclude cash and securities in the composite not held in the model portfolio. Quarterly data is not annualized. Portfolio attribution and characteristics are supplemental information only and complement the fully compliant International Developed Markets Equity Composite GIPS Presentation. Portfolio holdings should not be considered recommendations to buy or sell any security.

<sup>1</sup>Benchmark index. <sup>2</sup>Supplemental index. <sup>3</sup>Variability of the Composite, gross of fees, and the index returns over the preceding 36-month period, annualized. <sup>4</sup>Asset-weighted standard deviation (gross of fees). <sup>5</sup>The 2024 YTD performance returns and assets shown are preliminary. N.A.—Internal dispersion less than a 12-month period. N.M.—Information is not statistically significant due to an insufficient number of portfolios in the composite for the entire year.

The International Developed Markets Equity Composite contains fully discretionary, fee-paying accounts investing in non-US equity and equity-equivalent securities and cash reserves, and is measured against the MSCI World ex US Total Return Index (Gross) for comparison purposes. Returns include the effect of foreign currency exchange rates. The exchange rate source of the benchmark is Reuters. The exchange rate source of the Composite is Bloomberg. As of December 31, 2022, the International Developed Markets Equity Composite benchmark was changed from MSCI EAFE Index to the MSCI World ex US Index for all periods. Additional information about the benchmark, including the percentage of composite assets invested in countries or regions not included in the benchmark, is available upon request.

The MSCI World ex US Index is a free float-adjusted market capitalization index that is designed to measure equity market performance in the global developed markets, excluding the US. The index consists of 22 developed market countries. The MSCI EAFE Index (Europe, Australasia, Far East) is a free float-adjusted market capitalization index that is designed to measure developed market equity performance, excluding the US and Canada. The index consists of 21 developed market countries. You cannot invest directly in these indexes.

Harding Loevner LP claims compliance with the Global Investment Performance Standards (GIPS®) and has prepared and presented this report in compliance with the GIPS standards. Harding Loevner has been independently verified for the period November 1, 1989 through June 30, 2024.

A firm that claims compliance with the GIPS standards must establish policies and procedures for complying with all the applicable requirements of the GIPS standards. Verification provides assurance on whether the firm's policies and procedures related to composite and pooled fund maintenance, as well as the calculation, presentation, and distribution of performance, have been designed in compliance with the GIPS standards and have been implemented on a firm-wide basis. The International Developed Markets Equity composite has had a performance examination for the periods August 1, 2010, through June 30, 2024. The verification and performance examination report is available upon request. GIPS® is a registered trademark of CFA Institute. CFA Institute does not endorse or promote this organization, nor does it warrant the accuracy or quality of the content contained herein.

Harding Loevner LP is an investment adviser registered with the Securities and Exchange Commission. Harding Loevner is an affiliate of AMG (NYSE:AMG), an investment holding company with stakes in a diverse group of boutique firms. A list of composite descriptions, a list of limited distribution pooled fund descriptions, and a list of broad distribution pooled funds are available upon request.

Results are based on fully discretionary accounts under management, including those accounts no longer with the firm. Composite performance is presented gross of withholding taxes on dividends, interest income and capital gains for certain portfolios within the composite and net of withholding for others. Additional information is available upon request. Past performance does not guarantee future results. Policies for valuing investments, calculating performance, and preparing GIPS Reports are available upon request.

The US dollar is the currency used to express performance. Returns are presented both gross and net of management fees and include the reinvestment of all income. Net returns are calculated using actual fees. Actual returns will be reduced by investment advisory fees and other expenses that may be incurred in the management of the account. The standard fee schedule generally applied to separate International Developed Markets Equity accounts is 1.00% annually of the market value for the first \$20 million; 0.50% for the next \$80 million; 0.45% for the next \$150 million; 0.40% for the next \$250 million; above \$500 million upon request. Actual investment advisory fees incurred by clients may vary. The annual composite dispersion presented is an asset-weighted standard deviation calculated for the accounts in the composite the entire year.

The International Developed Markets Equity Composite was created on February 28, 2010, and the performance inception date is March 1, 2010.
